3.2 TRAINING DELIVERY

1. The delivery of training shall adhere to the design of the curriculum. Delivery shall be guided by the principles of competency-based TVET.
 - a. Course design is based on competency standards set by the industry or recognized industry sector; (Learning system is driven by competencies written to industry standards).
 - b. Training delivery is learner-centered and should accommodate individualized and self-paced learning strategies.
 - c. Training can be done on an actual workplace setting, simulation of a workplace and/or through adoption of modern technology.
 - d. Assessment is based in the collection of evidence of the performance of work to the industry required standards.
 - e. Assessment of competency takes the trainee's knowledge and attitude into account but requires evidence of actual performance of the competency as the primary source of evidence.
 - f. Training program allows for recognition of prior learning (RPL) or current competencies.
 - g. Training completion is based on satisfactory performance of all specified competencies.
2. The competency-based TVET system recognizes various types of delivery modes, both on-and off-the-job as long as the learning is driven by the competency standards specified by the industry. The following training modalities and their variations/components may be adopted singly or in combination with other modalities when designing and delivering training programs:

2.1. School/Institution- Based:

- Dual Training System (DTS)/Dualized Training Program (DTP) which contain both in-school and in-industry training or fieldwork components. Details can be referred to the Implementing Rules and Regulations of the DTS Law and the TESDA Guidelines on the DTP;
- Distance learning is a formal education process in which majority of the instruction occurs when the students and instructor are not in the same place. Distance learning may employ correspondence study, audio, video, computer technologies or other modern technology that can be used to facilitate learning and formal and non-formal training. Specific guidelines on this mode shall be issued by the TESDA Secretariat.
- Supervised Industry Training (SIT) or on-the-job training (OJT) is an approach in training designed to enhance the knowledge and skills of the trainee through actual experience in the workplace to acquire specific competencies as prescribed in the training regulations. It is imperative that the deployment of trainees in the workplace is adhered to training programs agreed by the institution and enterprise and status and progress of trainees are closely monitored by the training institutions to prevent opportunity for work exploitation.

- The classroom-based or in-center instruction uses of learner-centered methods as well as laboratory or field-work components.

2.2. Enterprise-Based:

- **Formal Apprenticeship** – Training within employment involving a contract between an apprentice and an enterprise on an approved apprenticeable occupation.
- **Informal Apprenticeship** – is based on a training (and working) agreement between an apprentice and a master craftsperson wherein the agreement may be written or oral and the master craftsperson commits to training the apprentice in all the skills relevant to his or her trade over a significant period of time, usually between one and four years, while the apprentice commits to contributing productively to the work of the business. Training is integrated into the production process and apprentices learn by working alongside the experienced craftsperson.
- **Enterprise-based Training** – where training is implemented within the company in accordance with the requirements of the specific company. Specific guidelines on this mode shall be issued by the TESDA Secretariat.

2.3. Community-Based – short term program conducted by non-government organizations (NGOs), LGUs, training centers and other TVET providers which are intended to address the specific needs of a community. Such programs can be conducted in informal settings such as barangay hall, basketball courts, etc. These programs can also be mobile training program (MTP).

3.3 TRAINEE ENTRY REQUIREMENTS

Trainees or students wishing to gain entry into this program must possess the following requirements:

- Able to read and write;
- Able to communicate, verbal or non-verbal; and
- Basic arithmetic skills

This list does not include specific institutional requirements such as educational attainment, appropriate work experience, and others that may be required of the trainees by the school or training center delivering the TVET program.

GLOSSARY OF TERMS

1) APRON	Is a canvas attached to the warp ends to start weaving.
2) APRONING	Is a process of tying the warp ends to the apron cloth that is attached to the cloth beam which start weaving process.
3) BACK BEAM / SAMBAYUNAN	Located above the warp beam. The warp beam passes over this firm support to maintain its tension. A corresponding surface called the breast beam, can be found at the upper front of the loom.
4) BEAMING	Is to wind the warp onto the warp beam. The layers of warp are usually separated with heavy paper or warping sticks.
5) BEATER	A frame attached to the loom near the cloth beam to hold the reed to beat the weft. It consists of a frame where the reed is inserted. The frame's top is removable to allow the easy installation of different sizes of the reed. When the appropriate reed is in place, the beater is used to press the weft perpendicularly against the warp and as weaving progress against the warp and as weaving progresses against the woven cloth. Beaters may either swing from a bar laid crosswise over the loom or from the side beam at the part of the loom.
6) BEATING / JERK	Means filling the thread to give firmness on the fabric.
7) BOBBIN / TALINYAS	Is a fabricated thread / yarn holder made of straw or bamboo where strands of fiber are winded to form the weft.
8) CLASSIFICATION	The quality control standard of the community practicing backstrap loom weaving.
9) CLOTH BEAM / LIKISAN	Holds the web or the woven fabric that can be found in the lower front of the loom. It is a beam directly below the breast beam. The newly woven cloth is wound and stored here.
10) COUNTERBALANCE LOOM	Are quiet and have a faster and softer treadling (requiring less weight) than jack-type looms.
11) CROSS STICK / SALIDSIRAN	Is a guide stick inserted to cross on the warp
12) FLOATING WEFT OR INLAID / PILI	Is a type of weaving that creates design in the cloth.
13) HARNESS	Is a string or tie used to attach the upper heddle bar to the head roller and lower heddle bar to the treadle.

14)HEDDLES	Is a cord with an eye. It carries the ends of the cord to the harness. Fabricated thru the use of strings, flat metal or iron. They have end loops where the harnesses and heddle bars are inserted in the central eye where the warp is threaded according to the draft or design plan. Heddles lift the individual warp thread during the weaving process so that the desired pattern may merge.
15)HEAD ROLLER / LIGID-LIGID	Refers to the round bar placed crosswise at the top of the loom and to the parallel bar below it. These roller support the ropes which keep the hanging in place.
16)HEDDLE BARS	These are narrow horizontal bars lie below the roller and are much shorter so they can be raised or lowered by pressing the loom's treadles to create a shed or opening on the warp. Heddle bars come in pairs. The upper bars are tied to the rollers which the lower bars are attached to the foot treadles with the heddles suspended between the bars. The set of harness per loom can range from two to as much as 24. Two-harness looms are so called because they have only two set of harnesses. In some looms, pairs of heddle frames, instead of bars are used to contain the heddles.
17)IN-LAID STICKS / BALILA	It is a flat wood measured 2.5" in x 0.25" in thickness. The length depends on the width of the cloth. It aids the weaver in creating designs on the woven cloth.
18)JACK-TYPE LOOM	As pressure is applied to the treadle (foot pedal), the harnesses rise as they are connected by jacks. This is why they are sometimes called "rising shed" looms. It is preferred by more experienced weavers as they only have to tie up the part of the warp that goes up, so it can cut your prep time in half when warping the loom.
19)LEASE STICKS	Are sticks that come with a loom. They usually match the loom width. Lease sticks can be used during the warping process to hold the cross.
20)MINOR REPAIR	The replacement of defective loom
21)PICK-UP STICK	A fabricated stick used to separate lift design heddles in-laid patterns called 'pili'.
22)RADDLE	Also called as a 'thread-spreader'; it is a wooden frame with legs whose upper edge is lined with metal loops made of ordinary nails.
23)RATCHET WHEEL	Wheels, made of wood or metal, the edge has equidistant teeth to lock the loom's rotating beams-such as the warp beam (at the back) or the cloth beam (in front) -in place. These device are kept stationary by

	catches fastened to the loom.
24) REED / SUYOD	It is tool made of very fine vertical equidistant metal strips enclosed with in a metal frame. Keep the warp threads neatly parallel & evenly spaced. During the weaving process, the reed beats the weft into place. Reeds are available in different sizes. The sizes are determined by the number of dents per inch. Although the finished web or cloth cannot exceed the width of the reed, the fineness or coarseness of a fabric is partly affected by the size of the reed used and how it is threaded.
25) SET-UP	Process of something ready to be used
26) SHED STICKS	Wider sticks, which are thin, flat and rounded at the ends and slanting at the edges. It may be made in various lengths and widths to suit the weaver' s requirement. These sticks are used to increase the width of the shed or to create variations on fabrics woven on plain-weaving looms or the 2-harness loom.
27) SHUTTLE / SIKUAN	Is a boat-like piece of wood which carries the bobbin with knotted fiber and is being thrown back and forth to form the desired cloth.
28) SLEY	Passing the warp through heddle thread and reed.
29) SPINDLE	A steel or coconut midrib stick (kugong) to secure the boat shuttle. Several bobbins are prepared so that weaving may be done continuously.
30) SPOOL / SKEIN HOLDER	Used to substitute a thread spreader when one is dealing with lesser quantities of thread. It is wooden block with vertical pegs projecting from surface. Each cone or skein of thread to be used is placed around a peg. Each cone or skein of thread to be used is placed around a peg.
